Professional Summary

Cloud & DevOps Engineer with 1.7 years of experience architecting and operating multi-cloud infrastructure (GCP, AWS, Azure) across multi-client, microservices environments. Google Cloud certified in DevOps and Cloud Architect, with a track record of driving GitOps CI/CD adoption, Kubernetes reliability, and infrastructure cost/performance optimization.

Skills

Cloud Platforms:	Google Cloud Platform (VM, VPC, Cloud Run, GKE, GCS, Cloud Build), Amazon Web Services (EC2, VPC, EKS, S3, Lambda) and Microsoft Azure (VM, VPC)
Infrastructure as Code:	Terraform, Ansible
Containers & Orchestration:	Docker, Kubernetes, Helm
CI/CD:	Jenkins, GitHub Actions, GitLab CI, ArgoCD, Git
Monitoring & Alerting:	Prometheus, Grafana, Cloud Monitoring & Logging
Scripting & OS:	Python, Bash/Shell, Linux
Database:	SQL

Work Experience

Enhub.ai — Associate Cloud Engineer

Feb 2025 – Present

Bangalore, India

- Architected modular Terraform configurations to provision core Cloud infrastructure and networking using a root-and-submodule structure with environment-specific `tfvars` files, and configured GitHub Actions to trigger provisioning on every commit for consistent, repeatable deployments across client environments.
- Built the observability stack from the ground up on GKE - deployed OTEL Collector, Prometheus, and Grafana via a custom obs-stack Helm release, wired Grafana to Cloud Monitoring through Workload Identity, and shipped live dashboards for GCP Resources, MongoDB Atlas, and ArgoCD.
- Centralized traffic routing for 40+ microservices under a single shared Ingress controller, cutting load balancer infrastructure overhead by 10% and streamlining cluster ingress management.
- Configured a dual-path telemetry pipeline on GKE - Loki and Tempo for real-time log/trace search (hot path), alongside a cold-path pipeline that streams data through Pub/Sub, transforms it via Dataflow and Cloud Run Functions, and archives it to GCS as Parquet for 60-day retention, queryable via BigQuery.
- Orchestrated a transition from push-based pipelines to ArgoCD-driven GitOps across the same microservice fleet, unlocking continuous state reconciliation, end-to-end auditability, and immediate rollbacks.
- Automated 289 Terraform-managed Grafana alert rules using 9 reusable modules (service, gRPC, event-handler, Kafka-lag monitors), standardizing alert creation across 30+ microservices without relying on manual Grafana UI configuration.
- Deployed and tuned a self-hosted multi-node OpenSearch cluster on GCP Compute Engine, syncing indexes with PostgreSQL to power real-time monitoring, analytics, and search across the platform.
- Served as sole on-call engineer for production infrastructure, triaging and resolving incidents 24x7 with minimal downtime and structured root-cause follow-up.

Tech Projects

Food Website: Secure DevSecOps CI/CD Pipeline | Jenkins, Docker, Kubernetes, Terraform, SonarQube, Trivy, OWASP Dependency-Check, Prometheus, Grafana

- Built an end-to-end multi-stage Jenkins pipeline orchestrating build, security analysis, containerization, and deployment of a Node.js web application.
- Integrated SonarQube for code quality gates and OWASP Dependency-Check to catch vulnerable NPM dependencies at build time, blocking non-compliant builds from progressing.
- Implemented Trivy for dual-level vulnerability scanning (filesystem and container image) to block critical vulnerabilities prior to registry push.
- Streamlined Docker container builds and image pushes to Docker Hub, establishing a fully containerized deployment flow.
- Provisioned infrastructure using Terraform and stood up real-time cluster monitoring with Prometheus and Grafana.

Enterprise GitOps Pipeline & Microservices on AWS EKS | AWS EKS, ArgoCD, GitOps, Jenkins, Kubernetes, Helm, Terraform, Prometheus, Grafana

- Implemented a declarative GitOps continuous delivery model using ArgoCD to auto-sync state between GitHub infrastructure configs and AWS EKS clusters, eliminating manual deployment drift.
- Provisioned and managed production-grade AWS EKS clusters using Terraform, configuring managed node groups, IAM Roles for Service Accounts (IRSA), and custom Ingress Controllers.
- Engineered a Jenkins CI pipeline for testing, immutable Docker image builds, container layer scanning, and tagged image pushes to the GitOps manifest repository.
- Authored structured Helm charts and Kubernetes manifests in Git as the single source of truth for frontend and backend microservice configuration.
- Integrated Prometheus and Grafana dashboards on EKS for real-time cluster performance, pod lifecycle, and ArgoCD sync-status monitoring.

Education

Sri Krishna College Of Engineering and Technology

Nov 2020 – Mar 2024

BTech in Information Technology

CGPA: 8.0/10

Certifications

Google Cloud Professional DevOps Engineer – Google Cloud

Google Cloud Professional Cloud Architect – Google Cloud
